regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                   Exendin, agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-paradial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in reatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. Found using
regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                          New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.

The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Blow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Exendin, agonist, Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.

Claim 18; Fig 4; 108pp; English.

```
AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of fype I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which hould be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Exendin, agonist, Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

                                                                                                                                                                                                                                                                      the
                                                                                                                                                  regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which hower plasma glucose levels and in treatment of disorders which lower benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              рę
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can lused for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as
                                    New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New exendin agonist peptides – can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can bused for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes hyperglycaemic or hypoglycaemic conditions. They can also be used for treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptyin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          27-MAY-1999.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAY24816;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which lower plasma glucose levels and in treatment of disorders which lower plasma glucose levels and in recatment of disorders which lower benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New exendin agonist peptides – can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which hower plasma glucose levels and in treatment of disorders which hower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                AAY24809 to AAY24877 represent exendin agonist peptides which can

The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in reatment of disorders which lower benefited with agents useful in delaying and/or slowing gastric emptying
           and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    regulate gastric motility and slow gastric emptying. The peptides can used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes hyperglycaemic or hypoglycaemic conditions. They can also be used for treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptyii
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                regulate gastric motility and slow 3, e.g. diabetes.
                                                                                                                                  Exendin, agonist, Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which lower plasma glucose levels and in treatment of disorders which would be benefited by agents which lower benefited with agents useful in delaying and/or slowing gastric emptying
          New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TOIG of: aay24811 check: 275 from: 1

                                                                                                                                                                                                                                                                                                                   Found
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in reatment of disorders which lower benefitted with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                              New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Exendin, agonist, Heloderma sp, Gila monster, venom, lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose, gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Type: P Check: 4889

The peptides can used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                             Exendin, agonist, Heloderma sp; Gila monster, venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 18; Fig 4; 108pp; English.

AAY17515 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                Exendin, agonist, Heloderma sp; Gila monster, venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are epptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Exendin, agonist, Heloderma sp, Gila monster, venom, lizard, diabetes mellitus type I, diabetes mellitus type II; hyperglycaemia, hypoglycaemia, plasma glucose, gastric emptying, stomach emptying.

```
AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to read diabetees mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
diabetes mellitus Lype I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                          Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.
                                                                                                                                                                                                                                                                                                                                                           Claim 28; Fig 4; 144pp; English.

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are epptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Maxico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                      Exendin, agonist, Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptide agonists of exendin - delay stomach emptying, for treating

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoplycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Exendin, agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAY17620;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to read diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                               Exendin, agonist, Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Exendin, agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAY17618 Length: 37 February 4, 2005 13:32 Type: P Check: 1706 Pound using 'seq5' (mohamed337.key)

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)

The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric.emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                              Exendin, agonist, Heloderma sp; Gila monster, venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptide agonists of exendin - delay stomach emptying, for treating

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAY17615;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAVI7535 to AAVI7624 represent exendin peptide agonists. Exendins are epetides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or they camena. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

AAY17535

```
AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to read diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Exendin, agonist, Heloderma sp; Gila monster, venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptide agonists of exendin - delay stomach emptying, for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2005 13:32 Type: P

The peptide agonists are used endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAY17515 to AAY17624 represent exendin peptide agonists. Exendins are epptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                       Exendin, agonist, Heloderma sp, Gila monster, venom, lizard, diabetes mellitus type I, diabetes mellitus type II; hyperglycaemia, hypoglycaemia, plasma glucose, gastric emptying, stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.

AAY17515 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are epitides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Waxico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
     Peptide agonists of exendin - delay stomach emptying, for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptide agonists of exendin - delay stomach emptying, for treating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAY17515 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                 Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             :

                                                           AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
      hypoglycaemia. They can also be used for in vitro and in vivo studies exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Exendin, agonist, Heloderma sp, Gila monster, venom, lizard, diabetes mellitus type I, diabetes mellitus type II, hyperglycaemia, hypoglycaemia, plasma glucose, gastric emptying, stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.

AAV17535 to AAV17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or they can also be used for in vitro and in vivo etudies on hypoplycaemia. They can they regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

```
AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are expetides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Waxico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAY17602;
  AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                       Exendin, agonist, Heloderma sp, Gila monster; venom; lizard; diabetes mellitus type I, diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Type: P Check: 326

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
Exendin, agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             for treating

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Waxico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Exendin, agonist, Heloderma sp; Gila monster, venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                             agonists of exendin - delay stomach emptying, for treating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAY17597;
  AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                          Exendin, agonist, Heloderma sp, Gila monster, venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow
                                                                                                                                                                AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to rote diabetees mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Exendin, agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetees mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                   Exendin, agonist, Heloderma sp; Gila monster, venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.

Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.

Claim 28; Fig 4; 144pp; English.

WPI; 1999-347456/29.

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)

The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.
                                                                                                                    Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.
                                                                                                                                                                                                                                                                    AAY17587 Length: 28 February 4, 2005 13:32 Type: P Check: 647 Found using 'seq5' (mohamed337.key)

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Exendin, agonist, Heloderma sp; Gila monster, venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

 AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They an also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                 Exendin, agonist, Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Peptide agonists of exendin - delay stomach emptying, for treating

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or they can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

```
AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                              AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat disbetees mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.

peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                        Exendin, agonist, Heloderma sp; Gila monster, venom; lizard, diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Peptide agonists of exendin - delay stomach emptying, for treating

                                                                                                                                                                                                                                                                                                               AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAY17535 to AAY17624 represent exendin peptide agonists.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       27-MAY-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAY17579;
```

```
AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetees mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or they can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Exendin, agonist, Heloderma sp; Gila monster, venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
               Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.
                                                                                                                                                                                                                                                                                                 AAY17574 Length: 28 February 4, 2005 13:32 Type: P Check: 630 Found using 'seq5' (mohamed337.key)

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                   Exendin, agonist, Heloderma sp; Gila monster, venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptide agonists of exendin - delay stomach emptying, for treating

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetees mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                             Peptide agonists of exendin - delay stomach emptying, for treating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAY17574;
    AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                        Exendin, agonist, Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAY17572: Length: 28 February 4, 2005 13:32 Type: P Check: .606 Found using 'seq5' (mohamed337.key)

                                                                                                                                                                                                                           AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAV17535 to AAV17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Exendin, agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                        stomach emptying, for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    for treating

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to read diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                            studies on
to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptide agonists of exendin - delay stomach emptying, for treating

Serine amide (G-87 provides amide group).
           Neidigh J.W., Fesinmeyer R.M., Prickett K.S., Andersen N.H.;
"Exendin-4 and glucagon-like-peptide-1: NMR structural comparisons in
the solution and micelle-associated states.";
Biochemistry 40:13188-13200(2001).
-!- FUNCTION: Has a VIP/secretin-like biological activity. Interacts
with the exendin receptor.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Expressed by the venom gland.
-!- SIMILARITY: Belongs to the glucagon family.
                                                                                                                                                                                                                                                                                                                                          PDB; 1JRJ; NRR; A=48-86.

J. Airlie: Purification and structure of exendin-3, a new pancreatic secretagogue isolated from Heloderma horridum venom.

A;Reference number: A23674; MUID:91056067; PMID:1700785
                                                                                                                                                                                                                                                                              A; Molecule type: protein
A; Residues: 1-39 < ENGS
A; Residues: 1-39 < ENGS
A; Cross-references: UNIPROT: P20394
C; Comment: Exendins are venom components that are thought to bind to receptors for vasoactive intestinal peptide and/or secretin on pancreatic acinar cells and to activate adenylate cyclase, resulting in secretion of amylase.
C; Superfamily: glucagon
C; Keywords: amidated carboxyl end; duplication; secretagogue; venom
F; 39/Modified site: amidated carboxyl end (Ser) #status experimental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A;Molecule type: protein

derived from Heloderma suspectum example. 1.29 mande derived from Heloderma suspectum example. 2 derived from Heloderma suspectum example. 3 in example of exendin analogues of the invention. The present invention provides methods and compositions for preventing and treating cardiac arrhythmias. The compositions comprise exendin, GLP-1, an incretin, a compound that binds to a receptor for GLP-1, or an agonist, analogue, derivative or variant of these compounds or their biologically active fragments. These compounds enhance peripheral glucose uptake by potentiating insulin secretion without inducing dangerous hypoglycaemia. They are effective at maintaining the electrochemical gradient across cardiac callular secretion without inducing dangerous hypoglycaemia. They are effective at embranes, thereby reducing the likelihood of arrhythmias developing. They also strongly suppress glucagon secretion, independent of its insulinotropic action, and thereby reduce plasma free fatty acid (FFA) clevels substantially more than can be accomplished with insulin. High FFA levels become implicated as a major toxic mechanism during myocardial ischaemia. The compounds can be administered by injection following an ischaemia. The compounds can be administered by injection following an ischaemia crevent or a cardiac intervention such as angioplasty, coronary bypass grafting or placement of an intracoronary stent, and can be used to treat or prevent ventricular arrhythmias such as cardiac ischaemia,
                                                                                                                                                                                                                                                                             Use of an incertin, a glucagon-like peptide-1, an exendin, or a compound that binds to a receptor for glucagon-like peptide-1 in the treatment of cardiac arrhythmias by metabolic intervention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is that of 14Leu, 25Phe exendin-4 (1-28) amide
                                                                                                                                                                                                                                                                                                                                                                                               Disclosure; SEQ ID NO 23; 49pp; English.

Use of an incertin, a glucagon-like peptide-1, an exendin, or a compound that binds to a receptor for glucagon-like peptide-1 in the treatment of cardiac arrhythmias by metabolic intervention.

Disclosure; SEQ ID NO 24; 49pp; English

The present sequence is that of 14Leu, 22Ala, 25Phe exendin-4 (1-28) amide derived from Heloderma suspectum exendin-4 ADD28643. It is an example of exendin analogues of the invention. The present invention provides methods and compositions for preventing and treating cardiac arrhythmias.

The compositions comprise exendin, GLP-1, an incretin, a compound that binds in a compound that is a compound to a these compounds or their biologically active fragments. These compounds enhance peripheral glucose uptake by potentiating insulin ascretion without inducting dangerous hypoglycaemia. They are effective at maintaining the electrochemical gradient across cardiac cellular membranes, thereby reducing the likelihood of arrhythmias developing. They also strongly suppress glucagon secretion, independent of its insulinocropic action, and thereby reduce plasma free fatty acid (FFA) levels substantially more than can be accomplished with insulin. High FFA levels have been implicated as a major toxic mechanism during myocardial schaemia. The compounds can be administered by injection following an ischaemia grafting or plasement of an intervention such as angiophasty, coronary bypass grafting or plasement of an interacoronary stent, and can be used to treat or prevent ventricular arrhythmias such as cardiac ischaemia,

Use of an incertin, a glucagon-like peptide-1, an exendin, or a compound that binds to a receptor for glucagon-like peptide-1 in the treatment of cardiac arrhythmias by metabolic intervention. Disclosure; SEQ ID NO 21; 49pp; English.

The present sequence is that of exendin-4 (1-28) amide derived from Heloderma suspectum exendin-4 ADQ28643. It is an example of exendin analogues of the invention. The present invention provides methods and compositions for preventing and treating cardiac arrhythmias. The compositions comprise exendin, Gib-1, an incretin, a compound that binds to a receptor for Gip-1, or an agonist, analogue, derivative or variant of these compounds or their biologically active fragments. These compounds enhance peripheral glucose uptake by potentiating insulin secretion without inducing dangerous hypoglycaemia. They are effective at maintaining the electrochemical gradient across cardiac cellular maintaining the reducing the likelihood of arrhythmias developing. They also strongly suppress glucagon secretion, independent of its insulinotropic action, and thereby reduce plasma free fatty acid (BFA) they have been accomplished with insulin. High FFA they are the control of the control levels have been implicated as a major toxic mechanism during myocardial ischaemia. The compounds can be administered by injection following an ischaemic event or a cardiac intervention such as angioplasty, coronary bypass grafting or placement of an intracoronary stent, and can be used to treat or prevent ventricular arrhythmias such as cardiac ischaemia, cardiac ischaemia, and congestive heart failure.

Use of an incertin, a glucagon-like peptide-1, an exendin, or a compound that binds to a receptor for glucagon-like peptide-1 in the treatment of cardiac arrhythmias by metabolic intervention.

Disclosure; SEQ ID NO 22; 49pp; English.

The present sequence is that of 14Leu, 25Phe exendin-4 amide derived from analogues of the invention. The present invention provides methods and compositions for preventing and treating cardiac arrhythmias. The compositions compression and treating cardiac arrhythmias. The compositions compression and treating cardiac arrhythmias. The compositions compression and treating cardiac arrhythmias. The compositions comprise exendin, GLP-1, an incretin, a compound that binds to a receptor for GLP-1, or an agonist, analogue, derivative or variant of these compounds or their biologically active fragments. These compounds enhance peripheral glucose uptake by.potentiating insulin secretion without inducing dangerous hypoglycaemia. They are effective at maintaining the electrochemical graddent across cardiac cellular.

Commons thereby reducing the likelihood of arrhythmias developing. They also strongly suppress glucagon secretion, independent of its insulintorropic action, and thereby reduce plasma free faity acid (FPA) insulintorropic action, and thereby reduce plasma free faity acid (FPA) insulintorropic action, and thereby reduce plasma free faity acid (FPA) insulintorropic action, and thereby reduce plasma free faity acid (FPA) insulintorropic action, and thereby reduce plasma free faity acid (FPA) is clevels have been implicated as a major toxic mechanism during myocardial ischaemia event or a cardiac intervention such as angioplasty, coronary bypass grafting or placement of an intracoronary stent, and can be used to treat or prevent ventricular arrhythmias such as angioplasty.

Cardiac ischaemia-reperfusion and congestive heart failure.

```
The present sequence is that of exendin-4 (1-30) peptide derived from Heloderma suspectum exendin-4 ADQ28643. It is an example of exendin analogues of the invention. The present invention provides methods and compositions for preventing and treating cardiac arrhythmias. The compositions comprise exendin, GLP-1, an incretin, a compound that binds to a receptor for GLP-1, or an agonist, analogue, derivative or variant of the exemple of the invention of these compounds or their biologically active fragments. These compounds enhance peripheral glucose uptake by potentiating insulin secretion without inducing dangerous hypoglycaemia. They are effective at maintaining the electrochemical gradient across cardiac callular membranes, thereby reducing the likelihood of arrhythmias developing. They also strongly suppress glucagon secretion, independent of its insulinotropic action, and thereby reduce plasma free fatty acid (FFA) levels have been implicated as a major toxic mechanism during myocardial ischaemia. The compounds can be administered by injection following an ischaemia. The compounds can be administered by injection following an ischaemic event or a cardiac intervention such as angioplasty, coronary bypass grafting or placement of an intracoronary stent, and can be used to treat or prevent ventricular arrhythmias such as cardiac ischaemia,
                          Use of an incertin, a glucagon-like peptide-1, an exendin, or a compound that binds to a receptor for glucagon-like peptide-1 in the treatment of cardiac arrhythmias by metabolic intervention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Exendin-4 (1-30); antiarrhythmic; cardiovascular-gen.; vasotropic.

The present sequence is that or exemble the sample of exendin analogues of the invention. The present invention provides methods and compositions for preventing and treating cardiac arithythmias. The compositions comprise exendin, GLP-1, or an agonist, analogue, derivative or variant to a receptor for GLP-1, or an agonist, analogue, derivative or variant of these compounds or their biologically active fragments. These compounds enhance peripheral glucose uptake by potentiating insulin secretion without inducing dangerous hypoglycaemia. They are effective at maintaining the electrochemical gradient across cardiac cellular membranes, thereby reducing the likelihood of arrhythmias developing. They also strongly suppress glucagon secretion, independent of its insulinotropic action, and thereby reduce plasma free fatty acid (FFA) clevels substantially more than can be accomplished with insulin. High FPA levels have been implicated as a major toxic mechanism during myocardial ischaemia. The compounds can be administered by injection following an ischaemia cevent or a cardiac intervention such as angioplasty, coronary bypass grafting or placement of an intervention such as angioplasty, coronary bypass grafting or placement of an intervention such as cardiac ischaemia, cardiac or cardiac ischaemia, cardiac ischaemia, cardiac ischaemia, cardiac isch
Use of an incertin, a glucagon-like peptide-1, an exendin, or a compound that binds to a receptor for glucagon-like peptide-1 in the treatment of cardiac arrhythmias by metabolic intervention.

The present sequence is that of the exendin-3 peptide of Heloderma harridum. This is a glucose-dependent insulinotropic peptide that enhances peripheral glucose uptake without inducing dangerous changerous properties and treating cardiac arrhythmias. The compositions for preventing and treating cardiac arrhythmias. The compositions comprise exendin, Ghr-1, an inoretin, a compound that binds to a receptor for GLP-1, or an agonist, analogue, derivative or variant of these compounds or their biologically active fragments. These compounds enhance compounds or their biologically active fragments. These compounds enhance inducing dangerous hypoglycaemia. They are effective at maintaining the electrochemical gradient across cardiac cellular membranes, thereby caughters glucagon secretion, independent of its insulinotropic action, and thereby reduce plasma free fatty acid (FRA) levels substantially more than can be accomplished with insulin. High FFA levels have been implicated as a major toxic mechanism during myocardial ischaemia. The compounds can be administered by injection following an ischaemia. The compounds can be administered by injection following an ischaemia cor placement of an intracoronary stent, and can be used to treat or prevent ventricular arrhythmias such as cardiac ischaemia, cardiac ischaemia, cardiac ischaemia, cardiac ischaemia, cardiac ischaemia.
                                                                                                                                               Use of an incertin, a glucagon-like peptide-1, an exendin, or a compound that binds to a receptor for glucagon-like peptide-1 in the treatment of cardiac arrhythmias by metabolic intervention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Type: P Check: 9591

glucose-dependent insulinotropic peptide that enhances peripheral glucose-dependent insulinotropic peptide that enhances peripheral glucose uptake without inducing dangerous hyperglycaemia. The present insulinotropic peptide that enhances peripheral glucose uptake without inducing dangerous hyperglycaemia. The present cardiac arrhythmias. The compositions compurise exendin, GLP-1, or an agonist, analogue, derivative or variant of these compounds or their biologically active fragments. These compounds enhance peripheral glucose uptake by potentiating insulin secretion without inducing dangerous hypoglycaemia. They are effective at maintaining the electrochemical gradient across cardiac cellular membranes, thereby reducing the likelihood of arrhythmias developing. They also strongly suppress glucagon secretion, independent of its insulinotropic action, and thereby reduce plasma free fatty acid (FFA) levels shave been implicated as a major toxic mechanism during myocardial ischaemia. The compounds can be administered by injection following an ischaemic event or a cardiac intervention such as
                                                                                                                                                                                                                                  present sequence is that of exendin-4 of Heloderma suspectum. This is
                                                                                                    Use of an incertin, a glucagon-like peptide-1, an exendin, or a compound that binds to a receptor for glucagon-like peptide-1 in the treatment of cardiac arrhythmias by metabolic intervention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  angioplasty, coronary bypass grafting or placement of an intracoronary stent, and can be used to treat or prevent ventricular arrhythmias such as cardiac ischaemia, cardiac ischaemia-reperfusion and congestive heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Exendin-4 (1-30); antiarrhythmic; cardiovascular-gen.; vasotropic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ADQ28643 Length: 39 February 4, 2005 13:33 Type: P Check: 9570 Found using 'seq5' (mohamed337.key)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     08-JUL-2004.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ADQ28648;
```

The present invention describes an incretin, a glucagon-like peptide-1 (GLP-1), an exendin or a compound that binds to a receptor for GLP-1, or their agonist, analogue, derivative or variant or fragment (I), that is used in the manufacture of a medicament for the prevention or treatment of nephropathy. (I) can be used in the manufacture of a medicament for the prevention or treatment of nephropathy; preventing progression of prevention or treatment of reduced vasodilatory capacity; reducing proteinuria, and preventing or slowing progression of glomerulosing proteinuria, and preventing or slowing progression of glomerulosclerosis associated with insulin resistance, diabetes and hypertension. The compounds act in part by improving insulin resistance, cation balance, hypertension and/or by facilitating glucose oxidation; including that by endothelial cells in the kidney and by other cells, rather by oxidation of free fatty acids; and so leads to an enhanced production of ATP for use by the cells and reduces oxidative stress on the affected tissue. The present sequence represents an axendin analogue peptide, which is given in the exemplification of the present invention. Use of an incertin, a glucagon-like peptide-1, an exendin or a compound that binds to a receptor for glucagon-like peptide-1, in the manufacture of a medicament for the prevention or treatment of nephropathy. Use of an incertin, a glucagon-like peptide-1, an exendin or a compound that binds to a receptor for glucagon-like peptide-1, in the manufacture of a medicament for the prevention or treatment of nephropathy.

Disclosure; SEQ ID NO 24; 50pp; English.

The present invention describes an incretin, a glucagon-like peptide-1 (GLP-1), an exendin or a compound that binds to a receptor for GLP-1, or their agonist, nailogue, derivative or variant or fragment (1), that is used in the manufacture of a medicament for the prevention or treatment of control or treatment of nephropathy. (1) has nephrotropic, antidiabetic and hypotensive control or treatment of nephropathy; preventing progression of prevention or treatment of nephropathy; preventing progression of compounds to end stage renal disease (ESRD); improving endothelial representation in the treatment of reduced vasodilatory capacity; reducing procremation in the treatment of reduced vasodilatory capacity; reducing procremation in the treatment of reduced vasodilatory capacity; reducing procremation in the treatment of reduced vasodilatory capacity; reducing procremation and preventing or slowing progression of glomeruloscierosis associated with insulin resistance, diabetes and hypertension. The compounds act in part by improving insulin resistance, cation balance, hypertension and/or by facilitating glucose oxidation; including that by endothalial cells in the kidney and by other cells, rather by oxidation of free fatty acids; and so leads to an enhanced production of ATP for use by the cells and reduces oxidative stress on the affected tissue. The present sequence represents an exendin analogue peptide, which is given in the exemplification of the present invention.

their agonist, an accompound that binds to a receptor for Gib-1, or their agonist, analogue, derivative or variant or fragment (1), that is used in the manufacture of a medicament for the prevention or treatment of nephropathy. (1) has nephrotropic, antidiabetic and hypotensive activities. (1) can be used in the manufacture of a medicament for the prevention or treatment of nephropathy; preventing progression of nephropathy to end stage renal disease (BSRD); improving endothelial function in the treatment of reduced vasodilatory capacity; reducing proteinuria; and preventing or slowing progression of glomerulosclerosis associated with insulin resistance, diabetes and hypertension. The compounds act in part by improving insulin resistance, cation balance, hypertension and/or by facilitating glucose oxidation; including that by endothelial calls in the kidney and by other cells, rather by oxidation of free fatty acids; and so leads to an enhanced production of ATP for use by the cells and reduces oxidative stress on the affected tissue. The present sequence represents an exendin-3 peptide, which is given in the present invention describes an incretin, a glucagon-like peptide-1 exemplification of the present invention

Use of an incertin, a glucagon-like peptide-1, an exendin or a compound that binds to a receptor for glucagon-like peptide-1, in the manufacture of a medicament for the prevention or treatment of nephropathy.

Disclosure; SEQ ID NO 14; 50pp; English.

The present invention describes an incretin, a glucagon-like peptide-1 (GLP-1), an exendin or a compound that binds to a receptor for GLP-1, or their agonist, analogue, derivative or variant or fragment (I), that is used in the manufacture of a medicament for the prevention or treatment of nephropathy. (I) has nephrotropic, antidiabetic and hypotensive of nephropathy. (I) has nephrotropic, antidiabetic and hypotensive of nephropathy to end stage renal disease (ESRD); improving endothelial repertation in the treatment of reduced vasodilatory capacity; reducing proteinuria, and preventing or slowing progression of glomerilosic proteinuria, and preventing or alowing progression of glomerilosic compounds act in part by improving insulin resistance, cation balance, hypertension and/or by facilitating glucose oxidation; including that by endothelial cells in the kidney and by other cells, rather by oxidation of free fatty acids; and so leads to an enhanced production of ATP for use by the cells and reduces oxidative stress on the affected tissue. The present sequence represent invention. 8X5CCCCCCCCCCCCCCXXXXXXXXXX

from polycystic ovary syndrome (PCOS). The method comprises administering a compound consisting of exendin, or its agonists or analogues, having a sequence given in the specification, where the subject exhibite at least one symptom of PCOS. The invention further relates to: reducing insulin resistance in a subject suffering from PCOS; preventing the onset of type 2 diabetres in a subject suffering from PCOS; restoring regular menses in a subject suffering from PCOS; restoring regular ovalation in a subject suffering from PCOS; restoring fertility in a subject suffering from PCOS invention apontaneous abortion in a subject suffering from PCOS. The nothod is useful in treating a subject suffering from PCOS. The PCOS. The method is useful in treating a subject suffering from PCOS. The polycystic ovary syndrome (PCOS) for reducing insulin resistance,

```
The invention relates to a novel method for treating a subject suffering from polycystic ovary syndrome (PCGS). The method comprises administering a compound consisting of exendin, or its agonists or analogues, having a compound consisting of exendin, or its agonists or analogues, having a compound consisting of exendin, where the subject exhibits at least cone symptom of PCOS. The invention further relates to: reducing insulin resistance in a subject suffering from PCOS; preventing the onset of type diabetes in a subject suffering from PCOS; restoring regular menses in a subject suffering from PCOS; restoring regular ovalation in a subject suffering from PCOS. The method is useful in treating a subject suffering from PCOS. The method is useful in treating a subject suffering from proyestic ovary syndrome (PCOS) for reducing insulin resistance, preventing the onset of type-2 diabetes; restoring regular menses, restoring regular ovalation and fertility or preventing spontaneous abortion in a subject. This sequence represents an exendin peptide used in the treatment of polycystic ovary syndrome of the invention.
                             Treating a subject suffering from polycystic ovary syndrome (PCOS) for reducing insulin resistance, restoring fertility or preventing spontaneous abortion by administering a compound consisting of exendin or

The method comprises administering a compound consisting of exendin, or its agonists or analogues, having a sequence given in the specification, where the subject exhibits at least one symptom of PCOS. The invention further relates to: reducing insulin resistance in a subject suffering from PCOS; preventing the onset of type -2 diabetes in a subject suffering from PCOS; restoring regular menses in a subject suffering from PCOS; restoring regular menses in a subject suffering from PCOS; preventing regular menses in a subject suffering from PCOS; preventing regular menses in a subject suffering from PCOS; preventing regular menses in a subject suffering from PCOS; preventing regular menses in a subject suffering from PCOS; preventing regular menses in a subject suffering from PCOS; preventing regular menses in a subject suffering from PCOS; preventing regular menses in a subject suffering from PCOS; preventing regular menses in a subject suffering from PCOS; preventing regular menses in a subject suffering from PCOS; preventing regular menses in a subject suffering from PCOS; preventing regular menses in a subject suffering from PCOS; preventing regular menses in a subject suffering from PCOS; preventing regular menses in a subject suffering from PCOS; preventing regular menses in a subject suffering from PCOS; preventing regular menses in a subject suffering from PCOS; preventing regular menses in a subject suffering from PCOS; preventing regular menses in a subject suffering from PCOS; preventing regular menses in a subject suffering from PCOS; preventing regular menses in a subject suffering from PCOS; preventing regular menses in a subject suffering from PCOS; preventing regular menses in a subject suffering regu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   exendin or
abortion in a subject. This sequence represents an exendin peptide used in the treatment of polycystic ovary syndrome of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (PCOS) for

or
suffering from PCOS; restoring fertility in a subject suffering from PCOS; preventing spontaneous abortion in a subject suffering from PCOS. The novel compounds of the invention may be used in gene therapy to treat PCOS. The method is useful in treating a subject suffering from polycystic ovary. syndrome (PCOS) for reducing insulin resistance, preventing the onset of type-2 diabetes; restoring regular menses, restoring regular menses, restoring regular actions and fertility or preventing spontaneous abortion in a subject. This sequence represents an exendin peptide used in the treatment of polycystic ovary syndrome of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel method for treating a subject suffering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Treating a subject suffering from polycystic ovary syndrome (PCOS) for reducing insulin resistance, restoring fertility or preventing spontaneous abortion by administering a compound consisting of exendin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     exendin

The invention relates to a novel method for treating a subject suffering from polycystic ovary syndrome (PCOS). The method comprises administering a compound consisting of exendin, or its agonises or analogues, having a compound consisting of exendin, or its agonises or analogues, having a compound of processing the subject exhibits at least one symptom of PCOS. The invention further relates to: reducing insulin resistance in a subject suffering from PCOS; restoring regular ovulation in a subject suffering from PCOS; restoring from PCOS; restoring from processing fertility in a subject suffering from PCOS.

The method is useful in treating a subject suffering from PCOS. The novel compounds of the invention may be used in gene therapy to treat PCOS. The method is useful in treating a subject suffering from PCOS. The method is useful in treating a subject suffering from processing fr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treating a subject suffering from polycystic ovary syndrome (PCOS) for reducing insulin resistance, restoring fertility or preventing spontaneous abortion by administering a compound consisting of exendin or
abortion in a subject. This sequence represents an exendin peptide used
in the treatment of polycystic ovary syndrome of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       polycystic ovary syndrome; PCOS; exendin; type-2 diabetes; ovulation; fertility; spontaneous abortion; gene therapy; insulin resistance; menses; Gila monster; exendin-4.

The invention relates to a novel method for treating a subject suffering from polycystic ovary syndrome (PCOS). The method comprises administering a compound consisting of exendin, or its agonists an analogues, having a sequence given in the specification, where the subject exhibits at least one symptom of PCOS. The invention further relates to: reducing insulin resistance in a subject suffering from PCOS; preventing the onset of type 2 diabetes in a subject suffering from PCOS; restoring the onset of type a subject suffering from PCOS; restoring from PCOS; restoring fertility in a subject suffering from PCOS cuffering from PCOS. The novel compounds of the invention and be used in gene therapy to treat pCOS. The method is useful in treating a subject suffering from PCOS. The method is useful in treating a subject suffering from PCOS. The method is useful in treating a subject suffering from PCOS. The method is useful in treating a subject suffering from PCOS. The method is useful in treating insulin resistance, preventing the onset of type-2 diabetes; restoring regular menses, restoring regular ovulation and fertility or preventing spontaneous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Treating a subject suffering from polycystic ovary syndrome (PCOS) for reducing insulin resistance, restoring fertility or preventing spontaneous abortion by administering a compound consisting of exendin or
abortion in a subject. This sequence represents an exendin peptide used in the treatment of polycystic ovary syndrome of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               exendin; type-2 diabetes; ovulation; gene therapy; insulin resistance;
                                                                                                    ADP48986 Length: 30 February 4, 2005 13:33. Type: P Check: 4889 Found using 'seq5' (mohamed337.key)
                                                                                                                                                                                                                                                                      1 match found in sequence:
   adp48987; Gila monster amidated exendin-4 peptide (1-28).

PCOS. The method is useful in treating a subject suffering from polycystic ovary syndrome (PCOS) for reducing insulin resistance, preventing the onset of type-2 diabetes; restoring regular menses, restoring regular ovulation and fertility or preventing spontaneous abortion in a subject. This sequence represents an exendin peptide used in the treatment of polycystic ovary syndrome of the invention.

ö Treating a subject suffering from polycystic ovary syndrome (PCOS) for reducing insulin resistance, restoring fertility or preventing spontaneous abortion by administering a compound consisting of exendin spontaneous abortion l its agonist or analog

Disclosure; SEQ ID NO 9; 65pp; English.

The invention relates to a novel method for treating a subject suffering a compound consisting of exendin, or its agonists or analogues, having a sequence given in the specification, where the subject exhibits at least one symptom of PCOS. The invention further relates to: reducing insulin resistance in a subject suffering from PCOS; preventing the onset of type 2 diabetes in a subject suffering from PCOS; preventing the onset of type subject suffering from PCOS; restoring regular menses in a subject suffering from PCOS; restoring regular ownlation in a subject suffering from PCOS; restoring from PCOS. The necessary of the invention in a subject suffering from PCOS.

pcOS. The method is useful in treating a subject suffering from polycystic ovary syndrome (PCOS) for reducing insulin resistance, preventing the onset of type-2 diabetes; restoring regular menses, restoring regular ovulation and fertility or preventing spontaneous abortion in a subject. This sequence represents an exendin peptide used in the treatment of polycystic ovary syndrome of the invention.

Treating a subject suffering from polycystic ovary syndrome (PCOS) for reducing insulin resistance, restoring fertility or preventing spontaneous abortion by administering a compound consisting of exendin or its agonist or analog

Claim 1; SEQ ID NO 14; 65pp; English.

The invention relates to a novel method for treating a subject suffering from polycystic ovary syndrome (PCOS). The method comprises administering a compound consisting of exendin, or its agonists or analogues, having a compound consisting of exendin, or its agonists or analogues, having a sequence given in the specification, where the subject exhibits at least cone symptom of PCOS. The invention further relates to: reducing insulin one symptom of PCOS. The invention from PCOS; preventing the onset of type can be subject suffering from PCOS; restoring regular menses in a subject suffering from PCOS; restoring from PCOS. The conventing spontaneous abortion in a subject suffering from PCOS or in a subject suffering from PCOS. The method is useful in treating a subject suffering from PCOS. The pCOS. The method is useful in treating a subject suffering from PCOS. The preventing the onset of type-2 diabetes; restoring regular menses, restoring regular ovulation and fertility or preventing spontaneous

Treating or preventing diabetes or diabetes-related disease by administering exendin-4 compound and thiazolidinedione insulin sensitizer to patient

Claim 7; SEQ ID NO 1; 31pp; English.

antidiabetic, immunosuppressive, cytostatic, anorectic, antilipaemic, hypotensive, antiarteriosclerotic, ophthalmological, nephrotropic, and neuroprotective. The method is useful for treating or preventing diabetes or a diabetes related disease chosen from type I diabetes, type 2 diabetes, type 2 diabetes, hyperglycaemia, latent autoimmune diabetes in adults, maturity onset diabetes, polycytic ovarian syndrome, gestational diabetes, hyperlipidaemia, hyperlipidaemia, hypertriglyceridaemia, hyperlipidaemia, hypertriglyceridaemia, arteriosclerosis, atherosclerosis, cardiovascular disease, diabetic retinopathy, bedropathy, proliferative retinopathy, diabetic nephropathy, neuropathy and diabetic neuropathy, where the patient is human. The method is useful for increasing the number of beta-cells in a more medicaments for carrying out the method; and a pharmaceutical composition comprising exendin-4 compound and thiazolidinedione preservative. The compositions and method have the following activities: The invention relates to a novel method for treating or preventing diabetes or a diabetes-related disease, which involves administering an exendin-4 compound and thiazolldinedione insulin sensitizer to the patient. The invention further comprises the use of exendin-4 compound and thiazolldinedione insulin sensitizer for the preparation of one or

The invention relates to a novel method for treating a subject suffering from polycystic ovary syndrome (PCOS). The method comprises administering a compound consisting of exendin, or its agonists or analogues, having a sequence given in the specification, where the subject exhibits at least one symptom of PCOS. The invention further relates to: reducing insulin resistance in a subject suffering from PCOS; preventing the onset of type -2 diabetes in a subject suffering from PCOS; restoring regular menses in a subject suffering from PCOS; restoring regular menses in a subject suffering from PCOS; restoring regular ovulation in a subject suffering from PCOS; preventing spontaneous abortion in a subject suffering from PCOS. The novel compounds of the invention may be used in gene therapy to treat

```
patient. The insulin sensitizer is useful for the preparation of one or more medicaments for carrying out the method. This sequence represents a 39 amino acid exendin-4 peptide isolated from the venom of the Gila monster lizard, Heloderma suspectum. This peptide is used to act as a potent GIP-1 receptor agonist for stimulating insulin release relating to the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                             polycystic ovary syndrome; PCOS; exendin; type-2 diabetes; ovulation; fertility; spontaneous abortion; gene therapy; insulin resistance;

Modified GLP-1 receptor agonists are useful for treating type 1 diabetes, cape 2 diabetes, maturity onset diabetes of the young, latent autoimmune diabetes adult, gestational diabetes of the young, latent autoimmune diabetes adult, gestational diabetes and Syndrome X (all claimed). They can also be used to treat hyperglycaemia, impaired glucose tolerance, impaired fasting glucose and obesity caused by inducing glucose-dependent insulin secretion. They may also be effective in the treatment of obesity, atherosolerocic disease, hyperlipidaemia, hypercholesterolaemia, low high density lipoprotein levels, hypertension, cardiovascular disease. Ow high density lipoprotein levels, hypertension, cardiovascular disease, peripheral vessel disease, physiological disorders and the secondary causes of diabetes. The modified GLP-1 creceptor agonists can be prepared by synthetic or recombinant methods. They induce glucose-dependent insulin secretion without reducing gastrointestinal motility, thereby lessening the gastrointestinal side-effects associated with previous GLP-1 receptor agonists.

albumin, involves microfiltration of fermentation broth containing fermentation-derived product at specific microfiltration temperature and such as interleukins, insulin, product Purifying fermentation-derived isolating final product.

Claim 25; Page 17; 20pp; English.

This invention relates to a novel method of purifying a fermentation-derived product, which involves microfiltration of a fermentation broth containing the fermentation-derived product at a microfiltration

temperature within the range from 66-90 degrees C and isolating the final product. The method of the invention is efficient in purifying a fermentation-derived product with an improved microfilitarion process comprising elevated temperatures. The present sequence is that of an exendin-4 analogue ZP10 peptide which is a fermentation-derived product to which the method of the invention may be applied. 888888888

Preventing and/or delaying diabetes in a subject in need, involves administering to subject a compound that increases beta-cell proliferation and/or reduces beta cell apoptosis in subject.

Disclosure; SEQ ID NO 2; 43pp; English

This invention relates to a novel method of preventing and/or delaying diabetes in a subject in need, which involves administering to the subject an effective amount of a compound that increases beta-cell proliferation and/or reduces beta-cell apoptosis in the subject. The invention may be useful for the production of compounds with an antidiabetic or immunosuppressive activity by increasing expression of protein kinase (Aktl and/or p444NRK) in the beta-cells and decreasing caspase-3 activation. The method is useful for preventing and/or delaying diabetes in a subject. The present sequence is that of a human exendin-4 peptide which is related to the method of the invention.

Harvesting a desired polypeptide produced by a recombinant host cell, for producing pharmaceuticals, comprises selecting a recombinant nucleic acid comprising nucleic acid fragments encoding a leader peptide and the polypeptide. WPI; 2004-042770/04.

Claim 4; Page 68; 109pp; English

The invention relates to a novel method for harvesting a (poly)peptide produced by a recombinant host cell. The novel method involves selecting a call comprising a first nucleic acid encoding a leader peptide and a second nucleic acid fragment encoding the desired (poly)peptide. The first nucleic acid and the leader peptide is functionally equivalent to an N-terminal leader peptide found with the pre-peptide of a lantiblotic. The host cells and nucleic acids are useful for producing, harvesting and post-translational modification of polypeptides. The polypeptides may be used in the production of pharmaceuticals, e.g. as antigen for vaccine or immunogenic composition. This sequence represents a polypeptide relating to the novel method of the invention.

receptor Novel glucagon-like peptide-1 receptor agonist or modified GLP-1 r agonist, useful for treating diabetes, impaired glucose tolerance, metabolic syndrome or pre-diabetic state.

Claim 1; SEQ ID NO 31; 56pp; English.

The present sequence is that of an exendin-4 peptide modified to include a PEGylated C-terminal Cys residue. This is an example of a modified glucagon-like peptide 1 (GLP-1) receptor agonist of the invention comprising a GLP-1 receptor agonist peptide linked to a polyethylene

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, an orectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                             Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia;

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, and antilipaemic activities. The novel composition and method anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obeatty, inhibiting food intake, such as impaired glucose tolerance, obeatty, inhibiting that an exendin agonist peptide of the invention.
                                        Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /note= "This residue forms a thioether bond with residue

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by
                                                                                                                                                                                                                                                                                                                     Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia dyslipidaemia or cardiovascular disease. This sequence represents an exemilia agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ADL66307;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, ano antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel pharmaceutical composition comprising an
                                                                                                                                                                                                                                                                                                                                                                                                                                                Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          exendin; extended-release formulation; plasma level; antidiabetic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Synthetic
                 Synthetic.
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperelycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25 $ of the predetermined release period. The composition has antidiabetic, an orectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 exendin, extended-release formulation, plasma level, antidiabetic, ancetic, antilipaemic, diabetes, glucose, gastric emptying, inhibiting food intake, tolerance, obesity, hyperglycaemia,
